

Mobilize Your Dynamics ERP System

Meet our main product

iWE.RP

is a platform that allows you to **transform your AX/ F&O** into modern **web and mobile** solutions without high upgrade and development costs

- **i** **WE.RP integrates** with your Microsoft Dynamics ERP system and comes with:
 - **Mobile** application builder
 - **Web** Application Builder
 - Administrative part containing systems: **document flow** and **access control**
 - **+ WEB API** for data exchange between the ERP system and any external applications

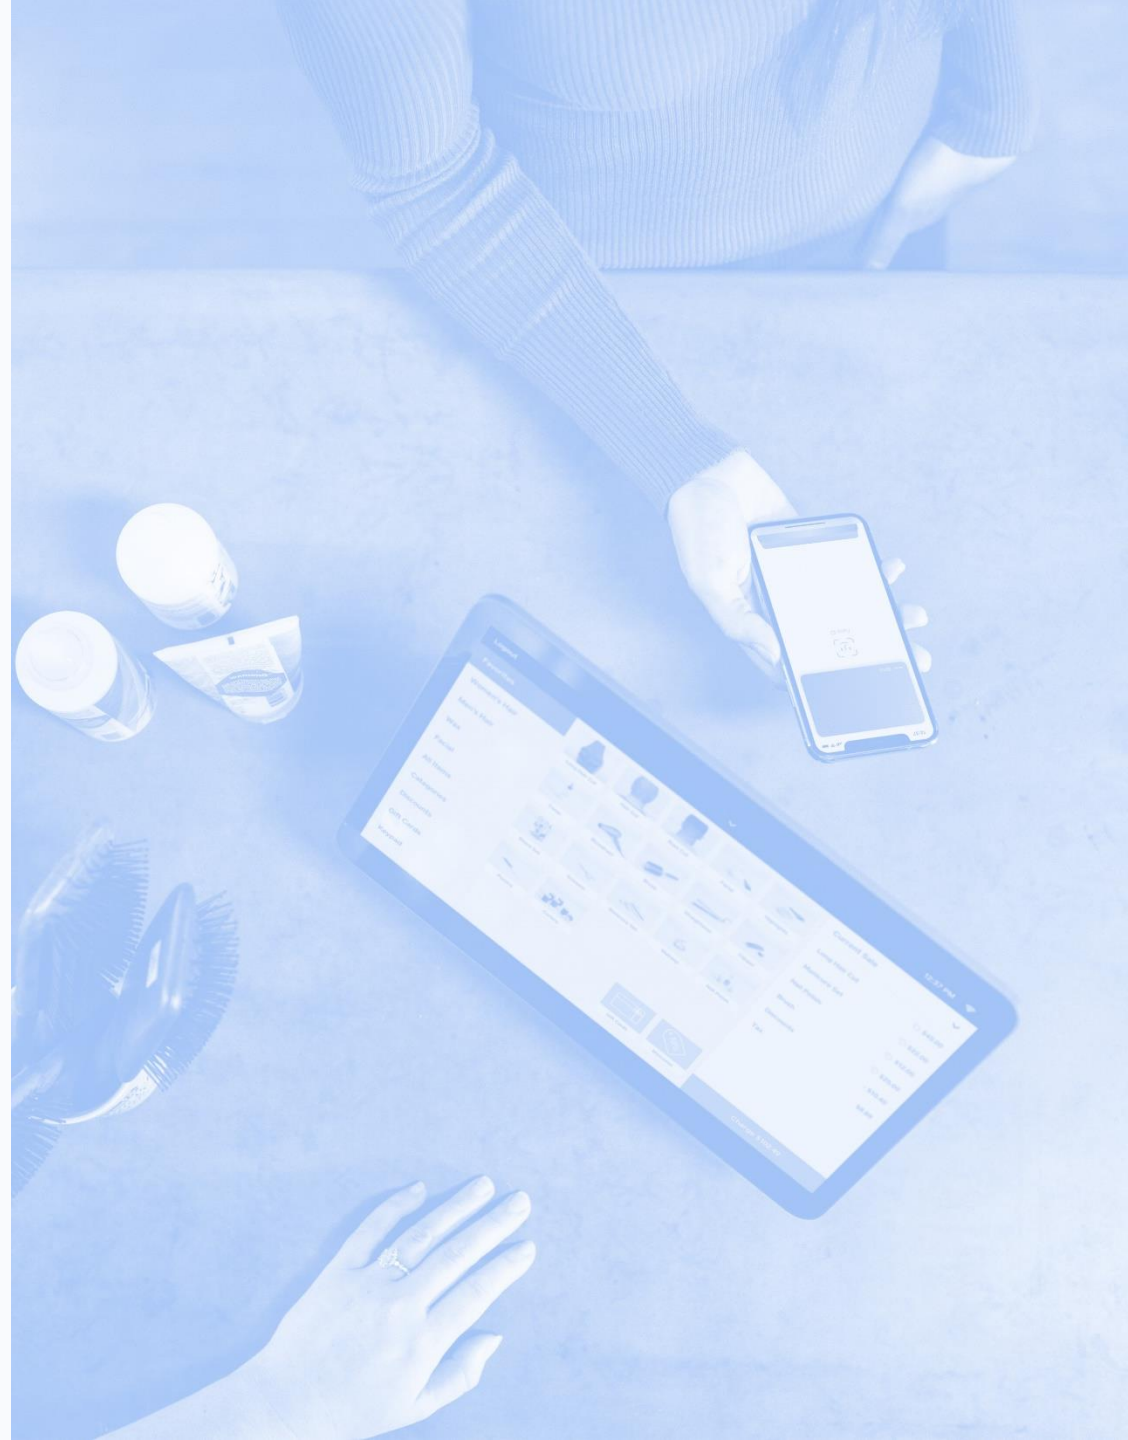

Problem and Solution

Problem:

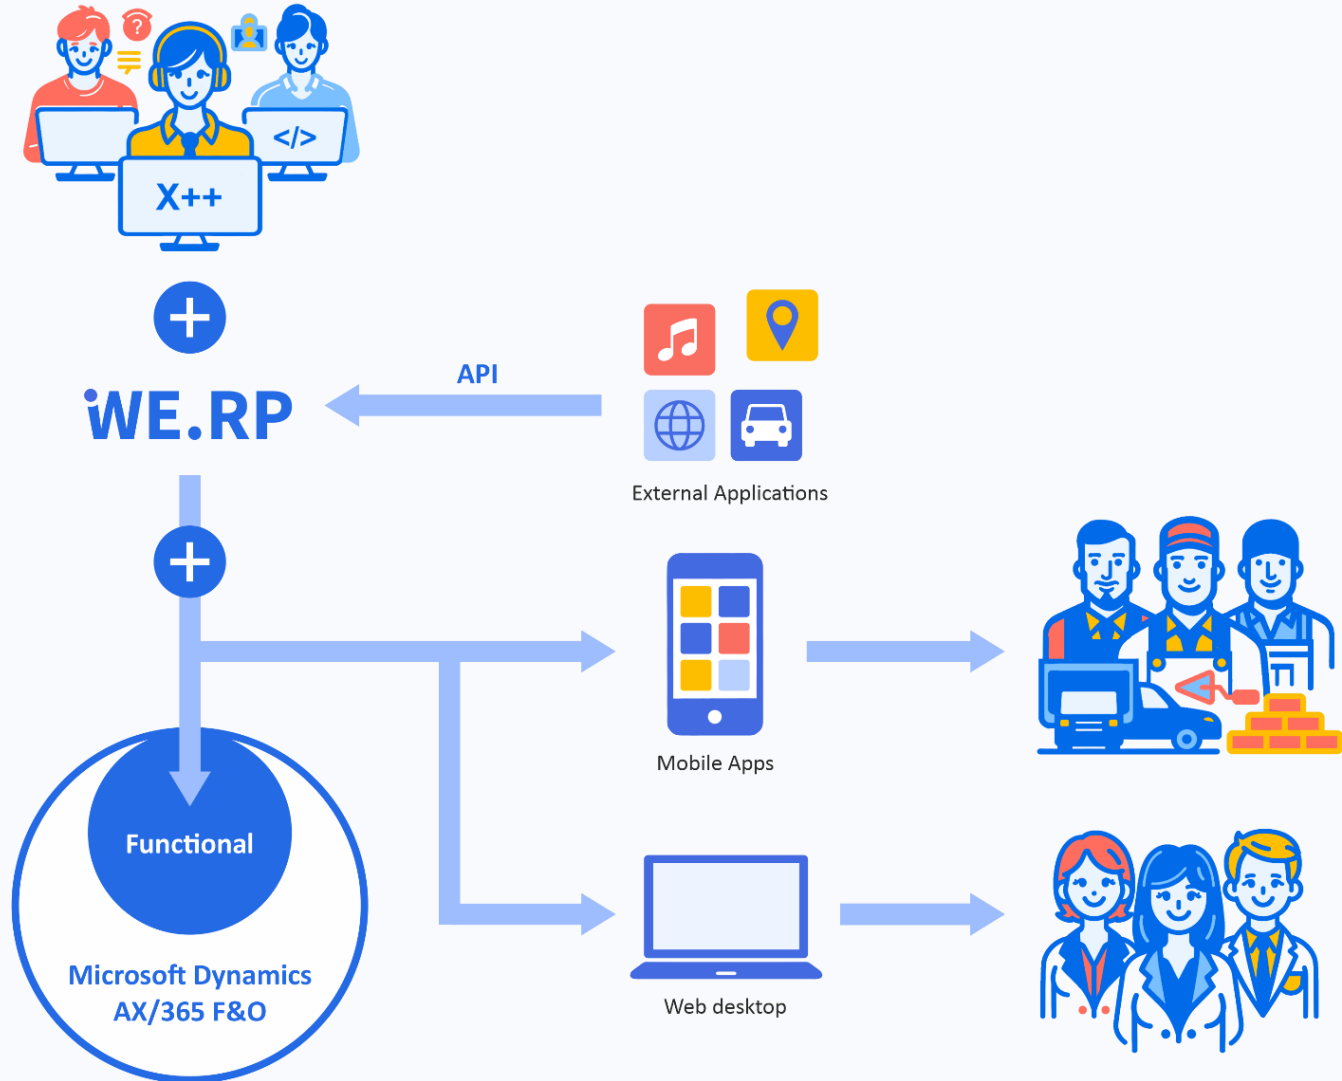

Restrictions of standard Dynamics ERP interfaces

Solution:

WE.RP is developed to overcome limitations, providing more flexible and efficient access to your ERP system

How it works?

WE.RP integrates directly with your Microsoft ERP system and is compatible with all versions.

Your ERP programmers can develop web and mobile apps based on existing logic and document flow.

Incorporate all your external apps using WE.RP. It's much easier with it than without.

Key Features

Modern interfaces for old versions of AX

The ability to create modern interfaces even for older versions of AX, increasing their functionality

Quick data update

Increase the speed of updating data, ensuring a quick response to changes in the business environment

Real time operation

Receive data from remote employees online and ensure information is always up-to-date anywhere in the world

Integration and adaptability

Integration with various versions of ERP systems and adaptive design for use on different devices

Get more for less

WE.RP allows you to avoid significant customization and expensive upgrades when creating new modules, which reduces the costs of system support

Advantages

✓ **Development in X++**

An experienced AX developer is enough to create web and mobile applications. X++ programming provides flexibility and efficiency in application development without the need to involve third-party developers.

✓ **Attractive features for desktop users**

For the convenience of employees who prefer the desktop interface, it's possible to create forms similar to Excel using a web designer.

✓ **Fast mobile transformation**

All features already implemented in AX can be made into mobile interfaces in just a couple of days - without restrictions.

✓ **Simplicity and safety**

WE.RP does not require the creation of a separate system of access rights (access control), ensuring ease of implementation and a high level of security.

✓ **Flexible cost of ownership**

Doesn't depend on the number of users, providing financial transparency.

Why not use the standard approach to app development?

Standard Approach vs WE.RP Approach

Standard Approach	WE.RP Approach
Data sharing problem with AX data	Working directly with AX data
The need to create a new security system	Using existing AX security system
Paid for logic twice (duplication of logic problem)	Using AX Logic
Dependency on programmers of different stacks	All software solutions inside AX
Additional costs for support and application updates	Your programmers support the solution

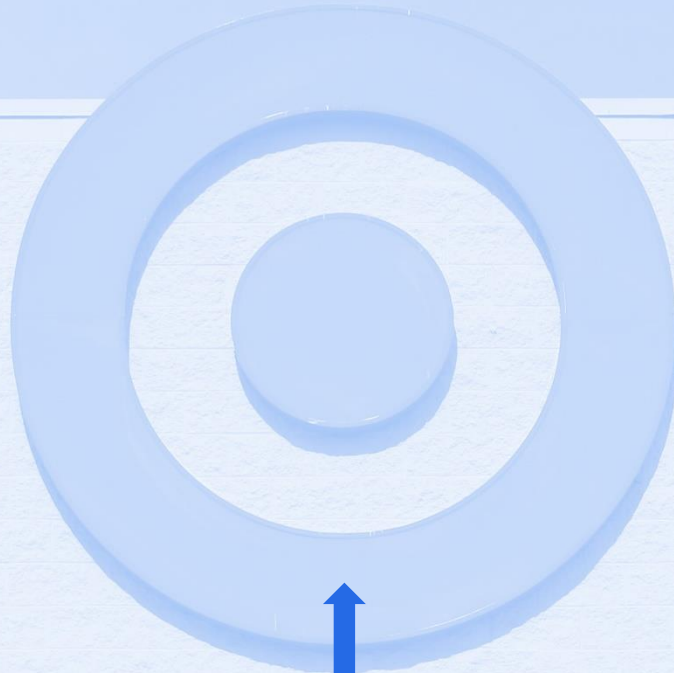

You can also order development from us:

- Benefit from use immediately
- Learn to use all the features of WE.RP

iWE.RP

allows you to create
an application for **any
business task**

Case: Optimization of the supply chain in a construction company using the WE.RP mobile solution

Problem:

A construction company, to ensure efficient operation, decided to implement a system for managing material inventories and delivery processes.

Solution:

We have implemented a comprehensive solution for AX, complemented by mobile and web interfaces of the WE.RP platform. The solution provides transparency, ease of interaction with suppliers, as well as effective management of warehouse operations.

Results

The adaptive solution sped up the work of employees, increasing productivity.

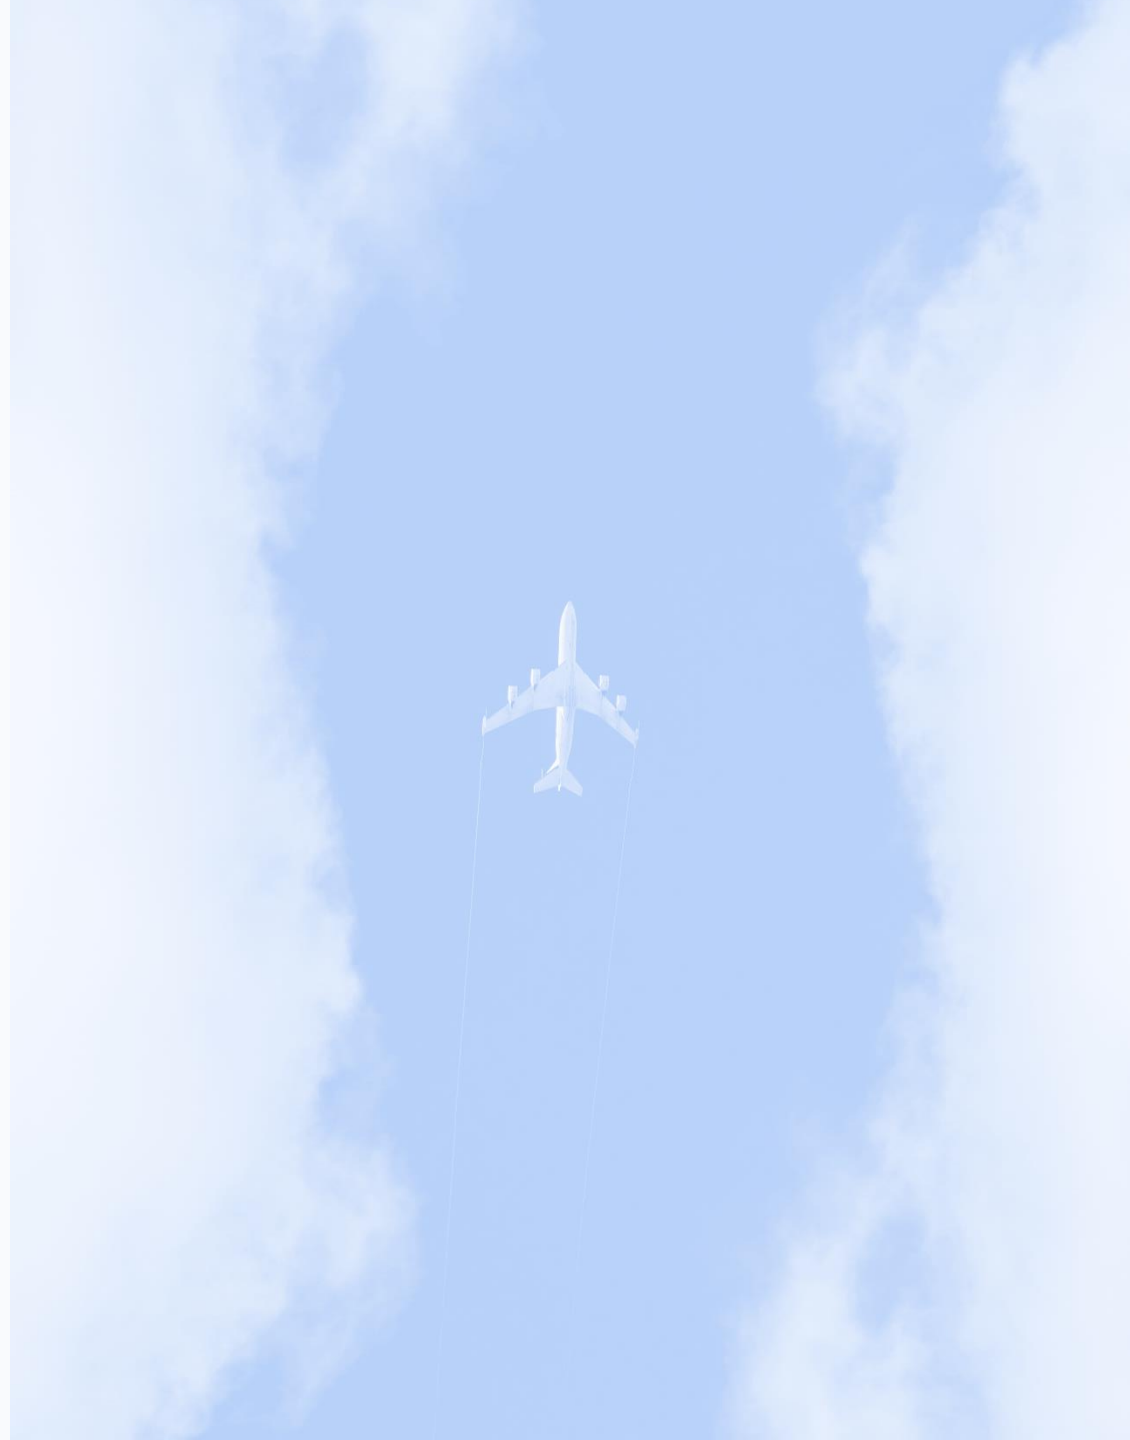

The solution is stored on the company's servers. To make changes, it is enough to assign a task to developers who have already worked on AX (X++ programmers)

The application also allows to minimize disputes with suppliers about defects.

Results

- Convenient material acceptance cycle
- Full transparency for all participants in the process
- The supplier selection algorithm takes into account key factors
- Mobile tool for work on site
- Prompt work with defects and preparation of closing documents

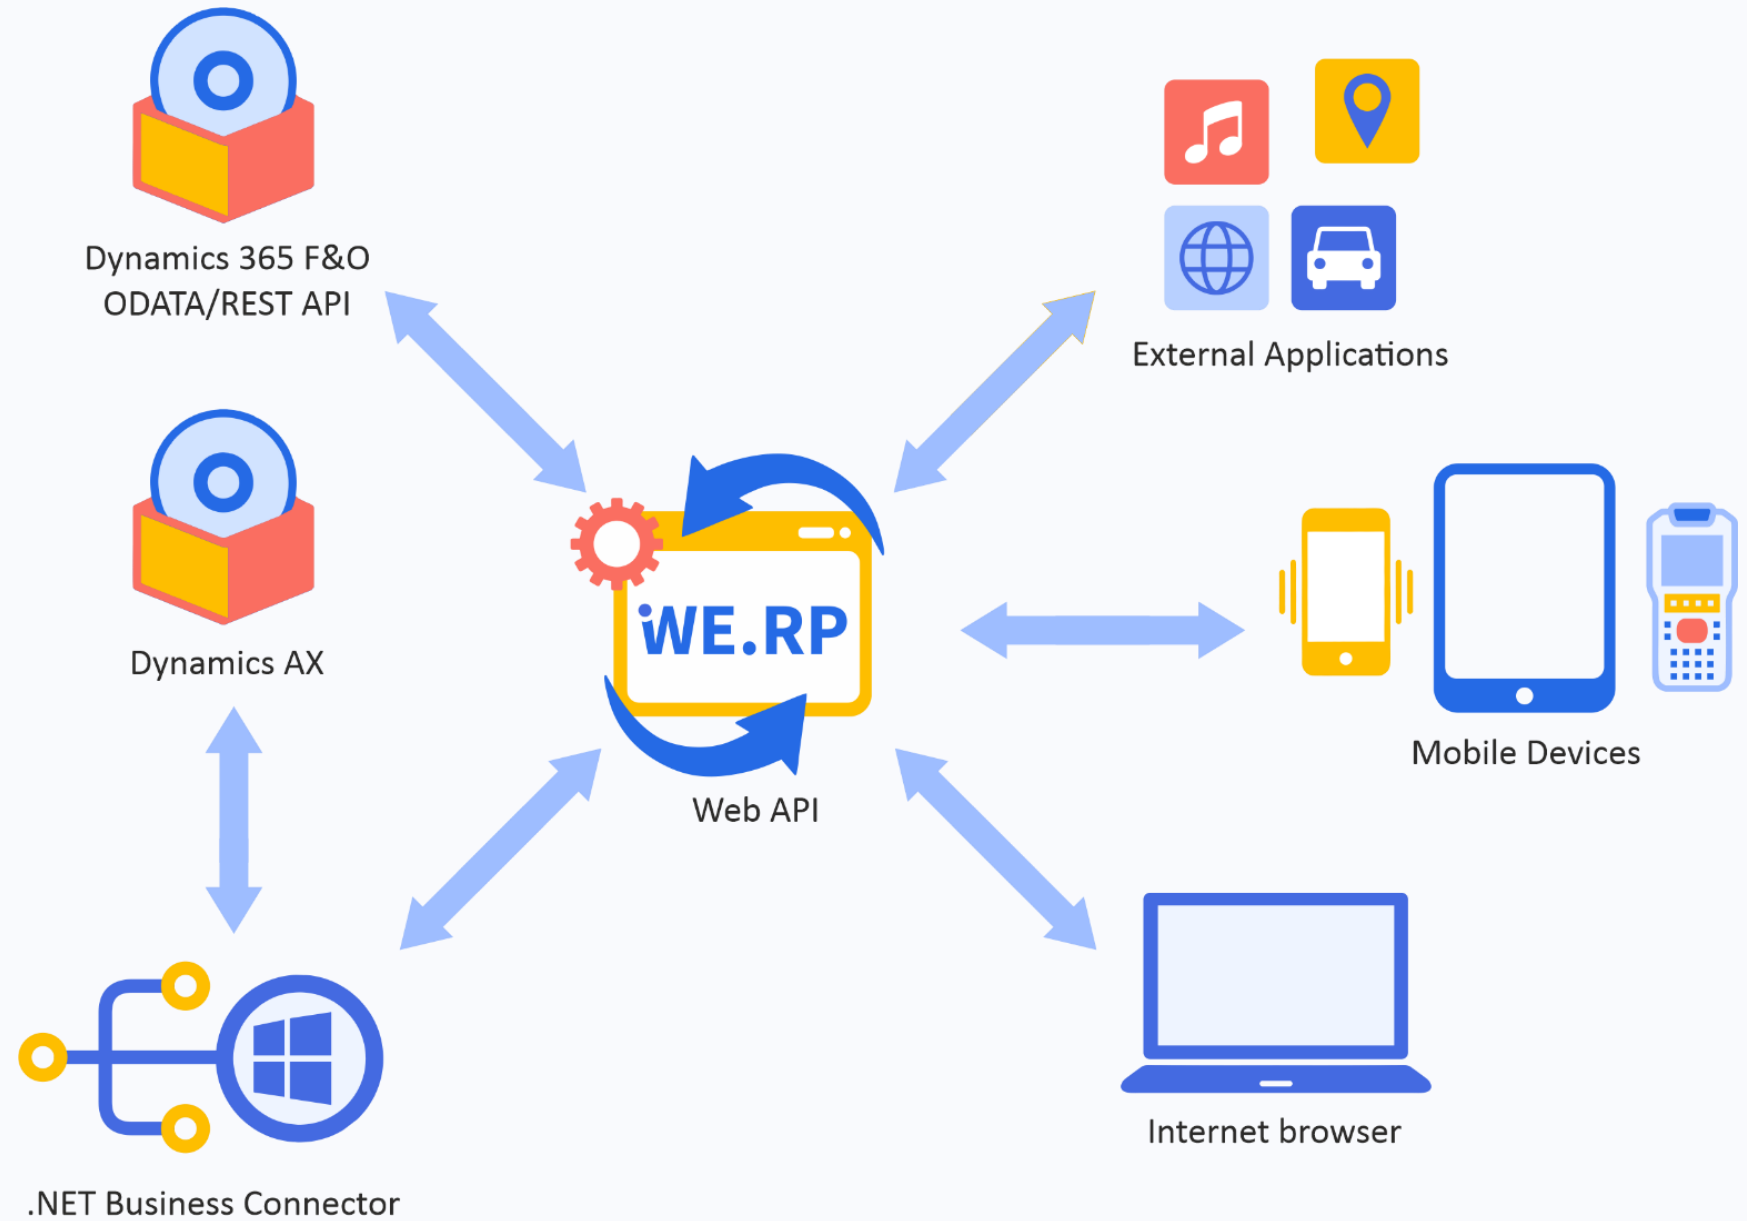

Results

- Security of transport identification upon delivery.
- Integration with document flow
- Ability to work offline and download data when communication is restored
- Top management can manage processes and make decisions online. Data from the warehouse is controlled through information slices
